Establishing correspondences across brain images:
surface- vs. volume-based registration

What types of registration are there?

Classify by...

...number of degrees of freedom (dof)

affine (12 dof)

nonlinear (>12 dof)

12 dof: 3 translations, 3 rotations, 3 scales, 3 shears

...registration steps

1. Similarity metric: (n)CR, SSD, MSD, (n)CC, MI,...
2. Transformation model: affine, piecewise linear, nonlinear,...
3. Regularization method: multi-resolution/scale, Gaussian blur,...
4. Optimization strategy: simplex, gradient descent,...
5. Interpolation type: nearest-neighbor, trilinear, cubic, sinc,...

Challenging example

template

target

What are some applications?

template
to target

target

1. morphometry

template

target

2. anatomical localization

3. “spatial normalization” for group analysis

4a. atlas-based labeling

4b. multi-atlas labeling

Why label brains?

(1) labels serve as a visual guide and teaching tool

- guide neurosurgery
- teach brain anatomy

(2) labels break up data within a brain

- quantify data by brain region
- assign results to brain regions

(3) labels establish correspondences across brains

- compare individuals within a study
- compare results across studies
- communicate results with a common language

How accurate is a registration?

How accurate is the *anatomical* correspondence?

“Evaluation of 14 nonlinear deformation algorithms applied to human brain MRI registration”

NeuroImage (2009)
<http://www.mindboggle.info/papers/>

Software	Similarity metric	Transformation
SyN	CC	bi-directional diffeomorphism (D)
ART	nCC	FFD based on cubic splines (H, np)
IRTK	nMI	cubic B-splines
SPM5 DARTEL	multinomial model: congealing	FDM of viscosity field (Dc)
JRD-fluid	Jensen-Rényi divergence	viscous fluid; variational calculus (D)
Diffeomorphic Demons	SSD	displacement field (D, np)
FNIRT	SSD	cubic B-splines
ROMEO	displaced frame difference	local affine
ANIMAL	CC	local translations
SICLE	SSD	3-D Fourier series (D)
SPM5 Unified Segment	generative segmentation	discrete cosine transforms
SPM5 “SPM2-type”	MSD	discrete cosine transforms
SPM5 Normalize	MSD	discrete cosine transforms
AIR	MSD	5th-order polynomial warps
FLIRT (linear)	nCR	linear, rigid-body

n = normalized
 CC = cross-correlation
 CR = correlation ratio
 MI = mutual information
 MSD = mean of squared differences
 SSD = sum of squared differences

D = diffeomorphic
 Dc = diffeomorphic, constant over time
 FDM = finite difference model
 FFD = free-form deformation
 H = homeomorphic
 np = nonparametric

“Evaluation of volume-based and surface-based brain image registration methods”

NeuroImage (2010)

Collaborators:	Software:	Space:
Satrajit S. Ghosh		
Brian Avants, James C. Gee	ANTs (SyN)	volume
Babak Ardekani	ART	volume
Bruce Fischl	FreeSurfer	surface
B.T.T. Yeo	Spherical Demons	surface

- first study to compare volume and surface registration methods
- first study to compare whole-head and brain-only image registrations
- compares registration accuracy with and without custom templates
- >16,000 registrations
- 80 manually labeled brain images for evaluation
- 2 different brain labeling protocols

Volume and Surface data (labeled in volumes **and** surfaces)

Registrations

Evaluation measures

Target overlap: $TO = \frac{\sum_r |S_r \cap T_r|}{\sum_r |T_r|}$

Union overlap: $UO = \frac{\sum_r |S_r \cap T_r|}{\sum_r |S_r \cup T_r|}$

Mean overlap: $MO = 2 \frac{\sum_r |S_r \cap T_r|}{\sum_r (|S_r| + |T_r|)}$

Volume similarity: $VS = 2 \frac{\sum_r (|S_r| - |T_r|)}{\sum_r (|S_r| + |T_r|)}$

Hausdorff Distance Error:

$$DE(S, T) = \sum_r \text{mean}(\text{mean}_{s \in S_r}(\text{inf}_{t \in T_r}(d(s, t))), \text{mean}_{t \in T_r}(\text{inf}_{s \in S_r}(d(s, t))))$$

Test 1: Volume labels and evaluation

Test 1 results

Volume registration methods

Rank 1 SyN with custom templates

Rank 2 SyN
ART

Permutation test

Surface registration methods

Rank 1 FreeSurfer with custom templates
Spherical Demons with custom templates

Rank 2 FreeSurfer with default atlas

Permutation test

Test 1 results

Tests 1-4 results

Tests 5: resampling error

Conclusions

1. Brain extraction aids volume registration.
2. Custom templates improve registration over direct pairwise registration.
3. Resampling volume labels on surfaces or surface labels on volumes precludes a fair comparison between surface and volume registration methods.

Recommendation

Construct a custom template from a limited sample drawn from the same or a similar representative population, using the same algorithm used for registering brains to the template.

Proposed Cortical Parcellation Protocol: SURVEY 1 SURVEY 2

Neuromorphometrics has developed a cortical parcellation (anatomical labeling) protocol that will be used by trained personnel to manually label an initial set of at least 800 to 1,000 T1-weighted MRI brain volumes as part of three different NIH-funded grants ([find out more](#)).

This protocol is derived from some of the best and most frequently used parcellation methods established by other research groups. From a detailed review of these methods, including their anatomic validity and consistency across brains, Jason Tourville and Ruth Carper have extracted the best approaches from each of these research groups and consolidated them into a single parcellation protocol.

The anatomically labeled brain images will be made publicly available online as a free, downloadable resource. In order to ensure that these anatomical labels are meaningful and useful to the neuroscientific community, we urge you to take the following two surveys.

SURVEY 1, below, collects your comments regarding the protocol.

[SURVEY 2](#) takes recommendations for additional datasets you wish to have us manually label.

Instructions

For each survey, please fill in your name and email address, fill in the survey and click the Submit button at the bottom of the survey.

Figure 2. Region-delimiting sulci (top) and proposed regions of interest (bottom) of the medial (left) and lateral (right) cortical surfaces are schematized (see lists above for abbreviation definitions). All regions, including optional regions are shown with the exception of entorhinal cortex. Boundaries not formed by sulci are indicated by dotted lines. Dividing planes are labeled (all lower case; dotted lines that are not labeled represent simple extensions of sulci). The curved arrow from the Calcarine Cortex ROI (Calc) to the calcarine sulcus indicates that the ROI lies within the sulcus.

Figure 3. Sulci and ROIs are shown on the dorsal (left group) and ventral (right group) surfaces. Boundaries not formed by sulci are indicated by dotted lines. Dividing planes are labeled (all lower case; dotted lines that are not labeled represent simple extensions of sulci).

Proposed Cortical Parcellation Protocol: SURVEY 1 SURVEY 2

Frontal Lobe (FL): Lateral Surface

Precentral Gyrus (PrG)
 Anterior: precentral sulcus --- Posterior: central sulcus --- Superior: superior margin of the interhemispheric fissure --- Inferior: lateral margin of the dorsal bank of the lateral fissure

Superior Frontal Gyrus (SFG)
 Anterior: frontomarginal sulcus --- Posterior: precentral sulcus / plane prcs-med --- Medial: superior margin of interhemispheric fissure --- Inferior: anteriorly: lateral orbital sulcus; posteriorly: middle frontal sulcus

Middle Frontal Gyrus (MFG)
 Posterior: precentral sulcus --- Superior: superior frontal sulcus --- Inferior: anteriorly: lateral orbital sulcus; posteriorly: inferior frontal sulcus

Inferior Frontal Gyrus (IFG)
 Posterior: precentral sulcus --- Superior/anterior: anteriorly: lateral orbital sulcus; posteriorly: inferior frontal sulcus --- Inferior: anteriorly: lateral orbital sulcus; posteriorly: lateral orbital sulcus / posterior projection from the posterior limit of the lateral orbital sulcus to the lateral sulcus

Regions of interest included in the protocol	Sulci included in the protocol and their abbreviations
ACgG anterior cingulate gyrus	aals anterior ascending ramus of the lateral sulcus
AIns* anterior insula	ahls anterior horizontal ramus of the lateral sulcus
AnG angular gyrus	aocs anterior occipital sulcus
Calc* calcarine cortex	cas callosal sulcus
CcG cingulate gyrus	ccs calcarine sulcus
CO central operculum	cgs cingulate sulcus
Cun cuneus	cis central insular sulcus
Ent entorhinal area	cos collateral sulcus
FO frontal operculum	crs circular insular sulcus
FuG fusiform gyrus	cs central sulcus
GrE gyrus rectus	fms* frontomarginal sulcus
IFG inferior frontal gyrus	fts* first transverse temporal sulcus
IOG inferior occipital gyrus	hs* Heschl's sulcus
ITG inferior temporal gyrus	ifrs inferior frontal sulcus
LIG lingual gyrus	ih* interhemispheric sulcus
MCgG* middle cingulate gyrus	it* intermediate transverse temporal sulcus
MFC* medial frontal cortex	iros inferior rostral sulcus
MFG middle frontal gyrus	itps intraparietal sulcus
MOG* middle occipital gyrus	its inferior temporal sulcus
MPOG postoccipital gyrus, medial segment	locs lateral occipital sulcus
MPG precentral gyrus, medial segment	los lateral orbital sulcus
MSFG superior frontal gyrus, medial segment	ls lateral sulcus
MTG middle temporal gyrus	ofs olfactory sulcus
OFC* orbitofrontal cortex	ots occipitotemporal sulcus
OFuG* occipital fusiform gyrus	pals posterior ascending ramus of the lateral sulcus
OpIFG opercular part of the inferior frontal gyrus	phls posterior horizontal ramus of the lateral sulcus
OrIFG orbital part of the inferior frontal gyrus	pis* primary intermediate sulcus
PCgG posterior cingulate gyrus	pocs postcentral sulcus
Pcu precuneus	pos parietooccipital sulcus
PHG parahippocampal gyrus	prcs* precentral sulcus
Plns* posterior insula	sbps subparietal sulcus
PO parietal operculum	sfrs superior frontal sulcus
PoG postoccipital gyrus	sros superior rostral sulcus
PP* planum polare	sts superior temporal sulcus
PrG precentral gyrus	
PT* planum temporale	
SCA subcallosal area	
SFG superior frontal gyrus	
SMC* supplementary motor cortex	
SMG supramarginal gyrus	
SOG superior occipital gyrus	
SPL superior parietal lobule	
STG superior temporal gyrus	
TriFG triangular part of the inferior frontal gyrus	
TTG transverse temporal gyrus	

* not included in the NeuroNames database

Dividing planes included in the protocol and their abbreviations
 The following dividing planes are used in the protocol.
 Planes are coronal unless specified otherwise:

calc-ant	anterior limit of the calcarine sulcus
cos-ant	anterior limit of the collateral sulcus
cs-med	dorsomedial limit of the central sulcus;
genu-post	marked by the posterior limit of the genu of the corpus callosum
ifs-ant	anterior limit of the inferior temporal sulcus
occ-ant	oblique medial-lateral plane given by a line drawn through points at (i) ventrolateral limit of the anterior occipital sulcus, (ii) jct of the lateral occipital sulcus and the anterior occipital sulcus, and (iii) the dorsomedial limit of the parietooccipital sulcus
ots-ant	anterior limit of the occipitotemporal sulcus
prcs-med	dorsomedial limit of the precentral sulcus
prcs-lat	ventrolateral limit of the precentral sulcus
pocs-lat	ventrolateral limit of the postcentral sulcus
pos-ant	anterior limit of the ventral bank of the parietooccipital sulcus
tf-jct	junction of the temporal and frontal lobes
splen-ant	anterior limit of the splenium of the corpus callosum

Recent review of brain registration algorithms:

“Brain functional localization: a survey of image registration techniques”

IEEE Trans Med Imaging. 2007. 26(4): 427-451. (330 references!)

Permutation tests

1. Select a subset of P independent brain pairs
2. Select a pair of methods (two vectors of P total overlap values)
3. Subtract the two vectors and compute the mean difference D
4. Select a subset of the elements from one of the vectors
5. Swap this subset across the two vectors
6. Subtract the resulting vectors; compute the mean difference D_p
7. Repeat steps #4-6 N times
8. Count the number of times n where⁴ $\text{abs}(D_p) \geq \text{abs}(D)$
9. Compute the exact p-value: $p = \frac{n}{N}$
10. Repeat steps #1-9; compute the fraction of times where $p \leq 0.05$

Main Page

Connectome Wiki is a knowledge base for macro- and mesoscale brain region and brain structural connectivity information across species. Employing modern semantic wiki technology, it serves as collaborative platform as well.

What can I get?

Brain Regions

Plenty of information, including links to relevant literature and much more.

Brain Connections

Well established neuronal connections based mainly on neuronal tracer studies from the literature.

Abbreviations

Look up abbreviations and corresponding English and Latin names

Partition Schemes

Foundational and more partitions with their corresponding delineation criteria and protocols.

Species

Information about different species is available, using their binomial name as identifier.

External

Enhance the [ConnectomeViewer](#) with Volume-To-Ontology mappings.

Data Source

You can download the raw data in [RDF](#) or [JSON](#).

What next?

[How To I News](#) | [Visualization](#)

What can I contribute?

If you research is in particular brain regions, or model organisms not yet registered, feel free to act as domain expert and add your knowledge.

If you do any tracer studies, add findings with appropriate published papers. Incrementally building a [mesoscale skeleton wiring diagram](#).

Complete any that is missing. See also [PapersToAdd](#).

Register your own partition scheme and link it semantically against known schemes.

Adding brain region pages for your particular research organisms.

Use ConnectomeWiki as knowledge backend for your application concerned with gross neuroanatomy.

Contact the [maintainer](#) if you have data to contribute.

[How To](#)
